

HESI Math Prep App

A practical guide for updating questions, rebuilding the app, and publishing changes to GitHub Pages

Public address: <https://tungprime.github.io/HESI/app/>

The original math-hesi-prep-source folder is the editable master copy. The tungprime.github.io/HESI/app folder contains only the compiled public website.

The two folders have different jobs

EDIT HERE	PUBLISH HERE
math-hesi-prep-source	tungprime.github.io/HESI/app
Contains CSV questions, exams, tutorials, React components, and configuration files.	Contains generated HTML, JavaScript, CSS, and fonts copied from the out folder.

Routine update: add questions to an existing CSV

1 Edit the source CSV

Open the original project and edit the appropriate file. Examples:

```
math-hesi-prep-source/data/topics/arithmetic.csv
math-hesi-prep-source/data/exams/practice-exam-1.csv
```

2 Build a fresh public version

Open Terminal in the original source folder and run:

```
npx next build --webpack
```

3 Replace the published files

Open the newly generated out folder. Replace everything inside tungprime.github.io/HESI/app with everything inside out. Copy the contents of out, not the out folder itself.

4 Commit and publish

In Terminal, run these commands:

```
cd "/Users/hapham/Downloads/github/tungprime.github.io"
git add "HESI/app"
git commit -m "Update HESI practice app"
git push origin master
```

Adding a completely new practice exam

A new exam usually needs both a CSV file and a small source-code registration step.

1 Create the exam CSV

Place the new file in the source project:

```
math-hesi-prep-source/data/exams/practice-exam-4.csv
```

2 Register the new exam

In VS Code, press Command + Shift + F and search for:

```
practice-exam-3.csv?raw
```

Open the matching loader file. Follow the existing Practice Exam 3 pattern to import and register Practice Exam 4. Adding the CSV alone will not create a new exam button if the loader uses a fixed list.

3 Build, copy, commit, and push

Follow Steps 2-4 from the routine update on page 1.

Important rules

- Always edit files in math-hesi-prep-source. Do not edit compiled JavaScript inside HESI/app/_next.
- Use `npx next build --webpack`. The project's npm build wrapper requires GNU timeout, which macOS does not provide by default.
- The exam CSV files do not appear separately in the published folder because Webpack bundles their contents into JavaScript during the build.
- Student progress remains in each student's browser. Publishing an update does not create a central student database.
- Do not commit `.DS_Store` files. They are macOS housekeeping files and are unrelated to the app.

Quick troubleshooting

Problem	What to check
Changes are not visible	Confirm that a new out folder was built and copied into HESI/app. Then push the Git commit.
GitHub shows File not found	Wait for Pages deployment, then use Command + Shift + R. The permanent URL is /HESI/app/.
CSV build errors	Build with <code>--webpack</code> and keep the CSV loader rule in <code>next.config.ts</code> .
A new exam is missing	Confirm that the new CSV was imported and added to the exam list before building.

Future improvement: GitHub Actions can automate the build and publishing process. Until that is configured, this manual workflow is the reliable method.
